

DID YOU HAVE BROWN SPOTS IN YOUR LAWN LAST YEAR?

If you noticed irregular brown patches in your lawn last fall, it may have been caused by grubs. Grubs are the larval stage of several beetles including the Japanese Beetle. They can be difficult to control and can cause extensive damage to a lawn once they become infested.

The beetles will lay between 40 to 60 eggs which then turn into hungry grubs. It is the grubs that cause the damage to your lawn by chewing off the roots near the soil's surface and your grass then dies.

EverGreen Lawn Care has a special treatment that we can apply to your lawn that will prevent these grubs from reaching maturity and causing so much damage to your beautiful lawn. This special application is time sensitive however. To be completely successful, we must apply this treatment in the next few weeks.

If you call now, we can protect your lawn from grub damage and we guarantee our results, but you must act now. Once you see the damage, it's too late.
